

SOCIAL FORESTRY

The college allocated about 3 acres of land for a Social Forestry Project on a land besides the State Highway and the railway line. Social Forestry in essence is planting of trees in idle and unused lands to encourage afforestation. This involved cultivating fast-growing trees like Sonajhuri to ensure sustainable resource management. Its primary aim is to promote environmental and social development in rural areas. The once barren land is now green giving shade and contributing towards lessening of global warming.
